Appln. No. 09/788,202

Attorney Docket No. 10541-098

I. Listing of Claims

(Original): A method for synchronizing data comprising:

providing a first and second computer system in a vehicle;

connecting the first and second computer systems via an interface;

maintaining a configuration indicator having bit values in a memory of the first

computer system;

maintaining a configuration indicator having bit values in a memory of the

second computer system;

transmitting the bit values corresponding to the configuration indicator from

the first computer system to the second computer system via the interface;

comparing the bit values of the configuration indicator of the first computer

system to the bit values of the configuration indicator of the second computer

system; and

triggering a resultant action upon detection of a mismatch of said bit values of

said configuration indicators.

2. (Original): The method according to claim 1, further comprising

monitoring for synchronization initiation events.

3. (Currently Amended): The method according to claim 2, wherein the

synchronization initiation events include startup of the vehicle, a startup of one of the

first [[or]] and the second computer systems, replacement of one of the first [[or]] and

the second computer systems, a failure event in one of the first [[or]] and the second

computer systems, an initiation of a diagnostic routine in the vehicle, and an initiation of data synchronization by a user of the first or the second computer system.

4. (Original): The method according to claim 1, wherein the first computer system comprises a voice control system and the second system comprises a navigation system.

(Original): The method according to claim 1, wherein the configuration
indicator of each computer system stores data related to the presence or absence of

a nametag.

6. (Original): The method according to claim 1, wherein the configuration

indicator of each computer system stores data related to one of a size, a time, a date

stamp, and a unique identifier of a file.

7. (Original): The method according to claim 1, further comprising the

second computer system transmitting the bit values corresponding to the

configuration indicator from the second computer system to the first computer

system.

8. (Original): The method according to claim 1, wherein said comparing

the bit values of the configuration indicator of the first computer system to the bit

values of the configuration indicator of the second computer system occurs in the

second computer system.

Appln. No. 09/788,202

Attorney Docket No. 10541-098

(Original): The method according to claim 1, wherein said comparing

the bit values of said configuration indicator of the first computer system to the bit

values of the configuration indicator of the second computer system occurs in both

the first and the second computer systems.

10. (Currently Amended): The method according to claim 1, wherein said

triggering a resultant action includes one of deleting all data corresponding to said

nametag configuration indictors of the first and the second computer systems,

deleting data corresponding to bits mismatched between said nametag configuration

indicator of the first computer system and said nametag configuration indicator of the

second computer system, and notifying a user of the first and second computer

systems of a mismatch between said nametag configuration indicators of the first

and second computer systems and prompting said user for further action.

11. (Original): The method according to claim 1, further comprising

notifying the first computer system by the second computer system of the completion

of the resultant action.

12. (Original): A method for synchronizing data between a first and second

computer system in a vehicle having a multiple vehicle system architecture, the first

and second computer systems being connected via an interface and each

maintaining a configuration indicator having bit values in memory, comprising the

steps of:

monitoring for synchronization initiation events;

upon detection of a synchronization initiation event, the first computer system transmitting the bit values corresponding to the configuration indicator to the second computer system via the interface;

comparing the bit values of the configuration indicator of the first computer system to the bit values of the configuration indicator of the second computer system; and

triggering the performance of a resultant action upon detection of a mismatch of the bit values of the configuration indicators.

- 13. (Original): The method according to claim 12, wherein the first computer system comprises a voice control system and the second computer system comprises a navigation system.
- 14. (Currently Amended): The method according to claim 12, wherein the configuration indicator of each of the <u>computer</u> systems stores data related to the presence or absence of a nametag.
- 15. (Original): The method according to claim 12, wherein the configuration indicator of each computer system stores data related to one of a size, a time, a date stamp, or a unique identifier of a file.
- 16. (Currently Amended): The method according to claim 12, wherein the synchronization initiation events include startup of said vehicle, startup of one of the first [[or]] and the second computer systems, replacement of one of said first or the

second computer systems, a failure event in one of the first or the second computer systems, initiation of a diagnostic routine in said vehicle, and initiation of data synchronization by a user of the first and the second computer system.

17. (Original): The method for the synchronization of data between a first and second computer system in a multiple vehicle system architecture according to claim 12, further comprising transmitting the bit values corresponding to the configuration indicator from the second computer system to the first computer system.

- 18. (Original): The method according to claim 12, wherein said comparing the bit values of the configuration indicator of the first computer system to the bit values of the configuration indicator of the second computer system occurs in the second computer system.
- 19. (Original): The method according to claim 12, wherein said comparing the bit values of the configuration indicator of the first computer system to the bit values of the configuration indicator of the second computer system occurs in both the first and the second computer systems.
- 20. (Currently Amended) The method according to claim 12 wherein the resultant action is a member selected from the group consisting of deleting all data corresponding to said nametag configuration indicators of the first and the second computer systems, deleting data corresponding to bits mismatched between said

nametag configuration indicator of the first computer system and said nametag configuration indicated indicator of the second computer systems system of a mismatch between said nametag configuration indicators of the first and second computer systems and prompting said user for further action.

21. (Original): The method for the synchronization of data between a first and second computer system in a multiple vehicle system architecture according to claim 12 further comprising notifying the first computer system by the second computer system of the completion of the resultant action.
